

Name \_\_\_\_\_

What is the strongest intermolecular force present for each of these substances? (London dispersion, hydrogen bonding, dipole-dipole)

- 1) hydrogen (H<sub>2</sub>) \_\_\_\_\_
- 2) carbon monoxide (CO) \_\_\_\_\_
- 3) silicon tetrafluoride (SiF<sub>4</sub>) \_\_\_\_\_
- 4) nitrogen tribromide (NBr<sub>3</sub>) \_\_\_\_\_
- 5) water (H<sub>2</sub>O) \_\_\_\_\_
- 6) acetone (CH<sub>2</sub>O) \_\_\_\_\_
- 7) methane (CH<sub>4</sub>) \_\_\_\_\_
- 8) benzene (C<sub>6</sub>H<sub>6</sub>) \_\_\_\_\_
- 9) ammonia (NH<sub>3</sub>) \_\_\_\_\_
- 10) methanol (CH<sub>3</sub>OH) \_\_\_\_\_

For each pair of molecules, please check off all intermolecular forces expected between them.

Name \_\_\_\_\_

12)

Which of the following pairs of compounds can form H-bonds? For those that can, mark the position of the partial positive ( $\delta^+$ ) and negative ( $\delta^-$ ) charges in the molecules and indicate where the H-bonds will form. For those that can't form H-bonds, describe the strongest IMF available to that pair of compounds.

a)

b)

c)

d)

13)

a) HF      b)  $\text{PCl}_3$       c)  $\text{FeCl}_2$       d)  $\text{SO}_2$       e)  $\text{F}_2$ 

Which of the preceding compounds is most likely to form a solid compound at room temperature? \_\_\_\_\_

Of the gases, which would be hardest to condense to a liquid under pressure? \_\_\_\_\_

HINT: rank from lowest to higher IMFs. Higher attractive forces mean higher boiling & melting points! Use your IMF reference sheet to judge relative strengths of different types of forces.
